0.a. Goal

15 PROTECT, RECOVER AND PROMOTE THE SUSTAINABLE USE OF TERRESTRIAL ECOSYSTEMS, SUSTAINABLE MANAGEMENT OF FORESTS, COMBAT THE DESERTIFICATION, DETERMINATE AND REVERSE THE LAND DEGRADATION AND DETERMINE THE LOSS OF CTU.

0.b. Target

15.1 By 2020, ensure the conservation, recovery and sustainable use of terrestrial and freshwater inland ecosystems and their services, in particular forests, wetlands, mountains and arid lands, in accordance with the obligations arising from international agreements

0.c. Indicator

15.1.1 Forest area as a percentage of the total land area

0.d. Series

Forest area as a percentage of the total land area

0.e. Metadata update

10/22/2020

0.f. Related indicators

No indicator related to

1.a. Organisation

Ministry of Land and Environment

1.b. Contact person(s)

Alberto António Macia

1.c. Contact organisation unit

National Directorate for Planning and Cooperation

1.d. Contact person function

Head of Department of Monitoring and Evaluation

1.e. Contact phone

2.a. Definition and concepts

To provide an accurate definition of the indicator, it is crucial to provide a definition of "Forest" and "Total land area".

According to FAO definitions, Floresta is defined as: "land covering more than 0.5 hectares with trees over 5 meters and a canopy cover of more than 10%, or trees capable of reaching these thresholds in situ . It does not include land predominantly under agricultural or urban use ".

2.b. Unit of measure

Hectares (Ha)

2.c. Classifications

Page: 1 of 3

Classifications are not used.

3.a. Data sources

Ministry of Land and Environment (National Directorate of Forests), National Forest Inventory

3.b. Data collection method

The data related to the indicator are collected in the National Forest Inventory whose details on the collection, quality control, measured variables, used equipment, measurement procedures, rigor and precision in the use and handling of the equipment are described in the National Forest Inventory Guidelines. Based on the results of the inventory, the specific areas that qualitatively respond to the indicator are described.

3.c. Data collection calendar

Until December 2027

3.d. Data release calendar

August 2028

3.e. Data providers

Ministry of Land and Environment

3.f. Data compilers

Ministry of Land and Environment

3.g. Institutional mandate

According to the Organic Statute of the Ministry of Land and Environment, which was approved by Resolution No. 30/2016 of October 31, published in the Boletim da República I Série - Number 85, the Ministry of Land, Environment and Rural Development, directs, plans and coordinates, controls and ensures the implementation of policies in the fields of Land and Geomatics Administration, Forests and Wildlife, Environment, Climate Change and Conservation Areas.

4.a. Rationale

The indicator provides a measure of the relative extent of the forest in a country. The availability of accurate data in a country's forestry area is an essential element for forest policy and planning in the context of sustainable development.

The forest area as a percentage of the total land area can be used as an *proxy* approximate the extent to which a country's forests are being conserved or restored, but it is only partly a measure of the extent to which they are managed in a manner sustainable.

4.b. Comment and limitations

The five sub-indicators chosen to illustrate progress towards sustainable forest management do not fully cover all aspects of sustainable forest management. In particular, social and economic aspects are summarized in the sub-indicators of areas under sustainable forest management plans. In addition, as trends are calculated using only countries that have complete time series of data, different sub-indicators may reflect different sets of countries.

While the panel illustrates the progress of the individual sub-indicators, there is no consideration of the relative importance of the sub-indicators

4.c. Method of computation

Forest area (reference year) / land area (2015) * 100

This indicator can be aggregated at the global or regional level, adding all country values globally or in a specific region

The proportion of forest area in the protected area and in the management plan is calculated using the reported areas and the official land area of FAOSTAT for the reference year 2015.

4.d. Validation

After the production of the information related to the indicator, which is produced by the National Directorate of Forests, it proceeds with its validation by the Consultative Council of the Ministry of Land and Environment.

4.h. Methods and guidance available to countries for the compilation of the data at the national level

Page: 2 of 3

The detailed methodology and guidance on how to prepare Country reports through an online web platform and convert national data according to national categories and definitions to FAO global categories and definitions can be found in the documents "Guidelines and Specifications" (www.fao.org/3/I8699EN/i8699en.pdf)

4.i. Quality management

A specific quality management system does not yet exist, however, the Forest Information System (SIF) is being operationalized, which was created with the aim of giving greater credibility to the information made available.

4.j. Quality assurance

Use of satellite image that makes it possible to analyze the data of the areas covered in the forests and which are available in the National Forest Inventory.

4.k. Quality assessment

No quality assessment has yet been carried out, according to standard quality criteria established by the United Nations

5. Data availability and disaggregation

The indicator is made available every ten years and has no breakdown.

6. Comparability/deviation from international standards

This indicator is internationally comparable.
